*The article deals with the traditional methods of obtaining point estimates with respect to the "hybrid" data, which are a type of fuzzy random variables. Using the theory of fuzzy linear systems shows that the treatment of "hybrid" data there are "strong/weak" point estimates of parameters. Is a simple example of processing fuzzy random data.*

**Keywords:** *hybrid data, hybrid data processing methods, "Strong/weak" assessment.*

**Mochalov I.A.** (b. 1941) graduated from the Moscow Institute for Power Engineering in 1965 and the Lomonosov Moscow State University in 1971. Dr. Sci. (Eng.), Professor of the Automatic Control Systems Department of Bauman Moscow State Technical University. Author of more than 100 publications in the field of theory and practice of optimization and identification of automatic control systems.

**Khrisat M.S.** (b. 1981) graduated from the New-York Institute Technology in 2007 get the master degrees, 2007 working in the Al-Balqa Applied University as Lecturer, 2012 studying in the Peoples' Friendships University of Russia. e-mail: mohd.khrisat@fet.edu.jo
