*We studied a simple kinematic model of guidance system for counter-overtaking modes. The maneuver target is modeled by stationary correlated random process. We use Kalman filter to estimate the coordinates of the phase state of the kinematic link, namely, the angular velocity of the line of sight and the normal acceleration of the target. The system of differential Riccati equations for the covariances of the errors due to the nonstationarity and nonlinearity in closed form is not amenable to study. However, in three special cases we found its closed solution in graphical or analytical forms. The need of simulation with the purpose of determining applicability of the obtained results is shown.*

**Keywords:** homing system, the kalman filter, the riccati equation.
