A development concept of program-methodical support for the simulation complex of functioning conditions of the orbital segment of global navigation and telecommunication geostationary satellite systems

L.N. Lysenko, A.G. Toporkov, V.V. Koryanov

Bauman Moscow State Technical University, Moscow, 105005, Russia

The article presents a concept of creating an information-computing complex of simulation in the form of adequate digital analogue of spatiotemporal field of ballistic navigation support for the functioning of the orbital segment of satellite systems, together with the "additions" and associated dynamic processes, included in the sphere of consumers' interests of satellite navigation of information.

Keywords: *simulation modeling, ballistic and navigation support, fundamental coordinate and time support, satellite systems, GLONASS.*
