The authors consider an approach to a consistent the description of wetting during the spreading of droplet along a solid surface. Arising problems in the description of motion can be solved considering the additional chemical potential (wedging pressure) for the liquid particles in thin layers of liquid near the contact line.

Keywords: *partially moistening liquid, superficial tension, thin film, near-surface pressure, three-phase contact, angle of liquids edge.*

Romanov A.S. (b.1947) graduated from Bauman Moscow Higher Technical School in 1971. Dr. Sci. (Phys. & Math.), Professor of the Department of Physics of Bauman Moscow State Technical University. Author of several works on the mechanics of fluids, gases, nonlinear transport processes. e-mail: rolmal@bk.ru

Semikolenov A.V. (b. 1966) graduated from tBauman Moscow Higher Technical School in 1989. Ph.D., Assoc. Professor of the Department of Physics of Bauman Moscow State Technical University. Author of several works on the mechanics of fluids, gases, nonlinear transport processes. e-mail: avsemik@mail.ru
