The mathematical model of attention dynamics and attention control is being developed, in continuation of the previous work, and the concepts of voluntary and involuntary attention, and of volition are introduced, in particular. Volition is being mathematically determined, and the will power is conceptualized as the mean value of volitions across all psychic processes involving voluntary control. The results obtained make it possible to conceptualize the processes of psychic self-control, as well as contribute to building their mathematical model.

Keywords: *attention dynamics, voluntary attention, involuntary attention, attention control, will, mathematical model of attention and will, determination of volition, psychic mechanisms of self-control.*

Glasko A.V. (b. 1973) graduated from Moscow State Technical University of Radio Engineering, Electronics and Automation in 1996. Ph.D., Assoc. Professor of the Higher Mathematics Department of Bauman Moscow State Technical University. Author of 35 publications. Research interests: mathematical of modeling. e-mail: petronyi@mail.ru

Sadikhova L.G. (b. 1971) graduated from Lomonosov Moscow State University. in 1998. Ph.D., Assoc. Professor of the Sociology and Cultural Department of Bauman Moscow State Technical University. Author of 48 publications. Scientific interests: theory of intercultural communication, communication models, methods, studies of the socio-cultural processes. e-mail: lala_sad@inbox.ru.

Vilisova N.T. (b. 1938) graduated from Abakan State Pedagogical Institute in 1961. Ph.D., Deputy Head on study of the Higher Mathematics Department of Bauman Moscow State Technical University. Author of 40 publications. Research interests: mathematical of modeling.
